## **As children's brains are being eaten by vaccines, parents urged to ignore the symptoms and 'soothe' their babies**

Saturday, April 21, 2012 by: Jonathan Benson, staff writer

(NaturalNews) A recent study published in the journal *Pediatrics* suggests that administering one or more of the five "Ss" -- swaddling, side/stomach position, shushing, swinging, and sucking -- to babies in conjunction with their childhood vaccine regimens can help alleviate the physical and emotional stress typically brought about by this highly-invasive medical tradition.

Swaddling babies, or wrapping them in a warm blanket after they are vaccinated, as well as placing them in certain positions can help reduce their levels of anxiety, say researchers. Gently shushing them while rocking them or giving them a pacifier can also help to make the vaccination process move along much more smoothly and less painfully.

Though these measures do absolutely nothing to address the potential neurological damage caused by vaccines, researchers say they can "soothe" babies and help them to stop crying. According to Dr. John W. Harrington from *Eastern Virginia Medical School* and *Children's Hospital of the King's Daughters* in Norfolk, the methods serve as a "distraction" from the pain caused by the needles.

For their study, Harrington and his colleagues divided 234 two- and four-month-old babies into four study groups, two of which received the five Ss after their vaccinations. They found that those who received these interventions experienced less visible pain, grimacing, and frowning, according to *Reuters*, and they cried less.

But as good as it might be to effectively comfort a child who has just been bombarded with dozens of vaccine injections, no amount of physical comfort will mitigate the damage being done to babies' brains by vaccines. The combination diphtheria, pertussis and tetanus shot, also known as DPT, for instance, is known to cause severe and permanent brain damage in some children ([http://www.naturalnews.com/031469\\_vaccine\\_brain\\_seizures.html](http://www.naturalnews.com/031469_vaccine_brain_seizures.html)).

All vaccines, in fact, come with the potential to cause permanent nerve damage, particularly in the brain. Going back as far as 1855, when Massachusetts passed the first law in the United States requiring vaccinations for schoolchildren, it was known that vaccines carried with them the risk of encephalitis, also known as inflammation of the brain ([http://www.naturalnews.com/031476\\_vaccines\\_nerve\\_damage.html](http://www.naturalnews.com/031476_vaccines_nerve_damage.html)).

Brachial neuritis, chronic inflammatory demyelinating polyneuropathy (CIDP), complex regional pain syndrome (CRPS), Guillain-Barre syndrome (GBS), multiple sclerosis, narcolepsy, Opsoclonus-Myoclonus syndrome (OMS), trigeminal neuralgia, and transverse myelitis are among the many neurological side effects that can be caused by vaccines. And none of these conditions, of course, can be mitigated with a pacifier or a blanket.
